Cooperating with

U. S. Department of Agriculture
Statistical Reporting Service

Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization extimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1980-81 CROP YEAR

CENTRAL FLORIDA

The 1980-81 season was continuously cold from mid December through the early part of February. The remainder of the November-March period was mild. Citrus trees were in their dormancy by the end of year. January brought a number of cold nights, with a major freeze on the 13th and 14th. Rainfall for the season was substantially below normal. By the end of March considerable supplemental irrigation was needed for citrus.

NOVEMBER: This was a fairly normal month, with many warm days and few cold nights. The first three weeks, night readings were recorded mostly in the 50's and low 60's. There were a few nights when temperatures dropped to the 40's. The first strong cold front moved through on the 27th. Temperatures dropped into the 30's on the 29th and 30th. Rainfall for the month averaged 3-5 inches.

DECEMBER: The first ten days of the month were above normal. A cold front on the 11th changed the weather pattern with the remainder of the month below normal. From the 12th to the 19th, lows were in the mid 30's and mid 40's and again from the 26th through the 31st, night temperatures were in this same range. Rainfall for the month averaged from 1-2 inches.

JANUARY: This month was extremely cold. All but five nights qualified as "cold nights". The first six days of the month continued cold from the front of late December. Lows were mostly in the 30's. Some pockets had durations below 28 degrees up to 4 to 6 hours. The morning of the 7th, temperatures were mostly in the 40's ahead of a rapidly moving cold front. Readings on the 8th to the 12th again dropped into the 30's and upper 20's. An active high pressure system dropped southward to reinforce the already cold air over the State. On the 13th, durations were below 28 degrees for 9 to 13 hours. Many spots were 20 degrees and below for 4 to 8 hours. On the 14th, durations below 28 degrees ranged from 6 to 10 hours. Another mass of cold air moved through the State on the 18th and 19th dropping lows to the 20's. The remainder of the month was cold, in the 30's and 40's, but most readings were above freezing. Rainfall ranged from 1/2-1 inch.

FEBRUARY: Coldest readings during the month were recorded from the 3rd to the 6th and 12th with upper 20's to mid 30's. Most of the other nights were in the 40's. Rainfall averaging 3-5 inches occurred mostly early in the month with no rain recorded after February 19.

MARCH: The month averaged about 3 degrees below normal. The first two weeks were cool with many nights in the 40's. On the 15th, 17th, 20th and 21st, readings were in the 30's at night. Minimum temperatures gradually warmed up to the 60's by the end of the month. Rainfall averaged 1-3 inches with most of the rain on the 22nd and 23rd.

SOUTH FLORIDA

The 1980-81 season was very cold. Both the Everglades and the Indian River District had the second greatest number of "cold nights" since records began. January was extremely cold through the entire month. Coldest mornings were on the 13th, 14th, and 19th when readings fell into the 20's. Durations below freezing averaged four to eight hours on each of these nights. Late December as well as February and March were rather cold. Rainfall for the season was below normal.

NOVEMBER: Lows for the first 28 days of the month were in the 50's and 60's. A few cool nights had lows in the upper 40's over the Interior. On the 29th and 30th lows fell into the 40's with a few 30's in the colder locations. The East Coast stayed near 50. Rainfall ranged from 3-5 inches, except for 5-6 inches along the Southeast Coast.

DECEMBER: The first 11 days of the month lows were mostly in the 50's. A succession of cold fronts for the remainder of the month kept lows in the 40's to low 50's in the Glades and mostly 50's to low 60's along the Southeast Coast. A strong cold front moved through on Christmas Day with lows the remainder of the month in the upper 30's and 40's. Rainfall averaged 1-2 inches.

JANUARY: Lows ranged form 30's to 40's during the month except for the 13th, 14th, and 19th when readings in many locations dropped to the 20's. A cold, high pressure system settled over the State at the beginning of the New Year. Temperatures dropped to freezing or a little below over the Indian River and Glades areas for the first time of the season. Cool readings continued for the next week and a half with lows mostly in the 40's. This was followed by an even colder period from the 11th through the 15th with the 13th and 14th being the lowest-in the upper 20's and 30's in the Glades and the Indian River District with 30's and 40's along the Lower East Coast. Temperatures warmed slightly on the 16th and 17th with another front dropping temperatures on the 18th to 20th. The night of the 19th was the coldest. The remainder of the month the nights were around the 40's in the Glades and low 50's along the Southeast Coast. Rainfall for the month was generally 1/2 to 1 inch.

FEBRUARY: Temperatures on the 4th fell below freezing in the Glades and Indian River but the lower East Coast area remained in the mid to upper 30's. From the 7th to the 21st the low readings were in the 50's to 60's. A cooler period occurred the last week of the month with temperatures in the mid to upper 30's except on the lower East Coast where 40's were reported. Rainfall ranged from 1 1/2 to 3 1/2 inches.

MARCH: The month was cooler than normal with lows the first three weeks mostly in the 50's and occasionally in the 70's at night. On the 21st, readings fell into the 30's. Afterwards there was a slow warming trend. Rainfall for the month averaged 1-2 inches.

1980-81 PRODUCTION SUMMARY

Florida's 1980-81 season began with first bloom showing by mid March despite freezing temperatures on March 3, in the historically cold areas. It was feared that the low temperatures would reduce the amount of bloom because of small twig damage, but a good bloom was experienced in all areas.

Post bloom weather was very dry until the usual summer rain period which began in the end of May and extended into September. Fall weather was dry except for some rain preceding cold fronts in late November.

January 1981 weather was very similar to conditions that prevailed during January 1977 when several days of subfreezing temperatures in the citrus producing areas of the State resulted in major damage to oranges and specialty crops. A detailed description of the freeze events is on the preceding weather highlights page.

Damage to oranges in the 1977 and 1981 freezes appeared to be similar. Approximately 15 percent of the pre-freeze forecasted boxes of oranges were lost in both years. However, the 1977 freeze affected fruit to some extent in most producing areas of the State, whereas the 1981 freeze left fruit unaffected in major portions of the East Coast and Lower Interior growing areas. This resulted in less loss of juice on the State level in 1981 than in 1977. The final FCOJ yield for 1981 at 43.4 degrees Brix was 1.20935 gallons per box compared to 1.11673 gallons per box in 1977, at the comparable Brix level.

Final orange production at 172,400,000 boxes, was 15 percent less than the initial October forecast of 203,000,000 boxes. This was 17 percent less than the 206,700,000 boxes produced in the 1979-80 season, but still more than the 1977-78 and 1978-79 seasons.

Grapefruit production at 50,300,000 boxes, was 8 percent less than the record 54,800,000 boxes produced in the 1979-80 season. Loss of fruit from the freeze however, was minimal. Specialty crop production with the exception of K-Early's, limes and lemons was greatly reduced by the freeze.

Citrus trees in the Upper Interior, West Coast and portions of the Lower Interior growing areas suffered varying degrees of damage because of the freeze. The lower minimum temperatures and longer durations produced more tree damage than the 1977 freeze. This damage ranged from completely killed trees in low ground, historically cold areas to light defoliation. Heavy pruning, even to the scaffold level, was necessary.

California's orange crop set a record for the second season with 66,250,000 boxes produced, 12 percent more than the previous season's 59,400,000 boxes. The major increase was in Navels. Grapefruit production was only slightly higher than the previous season but lemon production set a record with 24,800,000 boxes produced.

Arizona orange production was the lowest in many seasons primarily due to declining acreage. Grapefruit production was only slightly less than last season but lemon production, at 7,000,000 boxes, was substantially greater than the previous season.

Texas orange production, at 4,330,000 boxes was only slightly greater than last season, but still less than recent years' production levels. Bearing acreage has been declining since 1972. Grapefruit production, at 6,700,000 boxes, has been declining since the high 1976-77 season when 12,400,000 boxes were produced.

TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 600 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1968 through 1980 to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 845,283 acres of commercial citrus as of January 1980. This is a net increase of 1.7 percent from the 831,235 acres in January 1978. New citrus groves set during the calender years of 1978 and 1979 totaled 39,973 acres which more than offset the 25,925 acres lost. This is the first net increase in acreage since the 1970 survey. The net increases occurred in the East Coast and Lower Interior growing areas.

In addition to enumerating total changes in grove acreage, the surveys since 1976 were designed to give more detail on acreage removals and additions. As in past surveys, the 1980 results showed that about one half of the newly planted equivalent acres were resets in existing groves. Another 25 percent of the new plantings were on new land never before used for citrus. Again, as in past surveys, about 17 percent of the lost acreage occurred because of commercial development with the majority of the loss (58 percent) occurring as vacancies in existing groves.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1980, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	–	--
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	- 6.7	+2.3
1974	864,098	- 1.6	+ .7
1976	852,369	- 1.4	- .7
1978	831,235	- 2.5	- 3.1
1980	845,283	+1.7	- 1.5

1980-81 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of the 1980-81 citrus crop is $1,022,455,000. This is only slightly less than the 1979-80 season revised value of $1,037,050,000.

Preliminary value is based only on that part of the crop that was priced at harvest, about 30 percent. When all participation plans are finalized, a revised value will be calculated.

The 1980-81 season average on-tree price of oranges was $4.46 per box, an increase of 74 cents over the revised 1979-80 average of $3.72. Grapefruit prices rose to a record high $3.65 per box from the slightly revised 1979-80 price of $3.31. Most specialty crops, although reduced by the freeze, also showed an increase in per box returns.

The delivered-in price for all priced fruit going into FCOJ was $.99 per pound of solids, 16 percent greater than last season's $.85.

Florida, all citrus: Value of sales on-tree, crop years 1971-72 through 1980-81

Crop year	Value 1,000 dollars	Crop year	Value 1,000 dollars
1971-72	$427,245	1976-77	$ 529,765
1972-73	394,645	1977-78	848,680
1973-74	359,388	1978-79	966,916
1974-75	397,066	1979-80 1/	1,037,050
1975-76	440,326	1980-81 2/	1,022,455

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production is obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations provide the average F.O.B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final processing price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh exports of citrus to countries other than Canada and Mexico for the 1980-81 season were 10,589,000 cartons, only slightly more than the 1979-80 season when 10,454,000 cartons were shipped. Orange exports increased slightly from the previous season but are still below most preceeding seasons. As in previous seasons, Puerto Rico was the largest receiver of Florida oranges. Japan and Germany also took oranges in quantity.

Tangerines accounted for the major specialty crop exported with most of these going to Puerto Rico. Other varieties were not exported in quantity because of the freeze.

Grapefruit again accounted for the majority of citrus exports, 97 percent, with Japan the principal receiver. Over 60 percent of all grapefruit exports were to Japan with France taking slightly less than 20 percent and Holland slightly more than 10 percent.

Florida exported 11.4 million gallons of FCOJ at 45 degrees Brix in calendar year 1980, very close to 1979 exports. Canada continues to be the largest receiver for U.S. produced concentrate.

Increasing Brazillian production of FCOJ limits export market expansion opportunities for U.S. produced concentrate.

Citrus box weights: Approximate net weight in pounds by fruit type and States

States	Oranges and others 1/	Grapefruit	Tangerines	Lemons	Limes

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillipe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began, Florida's dominance of the Nation's citrus became even more apparent. In 1980-81, Florida had 69.1 percent of the Nation's production.

Footnote 2/ for page 34, 1/ for pages 35 and 36. Final Mexico import shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 34 thru 36 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases gave separate totals for these two types of citrus. Mexican shipments exclude Canadian shipments.

ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ed C. James, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Jackie Bowen, Alma Brewer, Ray Crickenberger, Joe Galant, Kitty Hildreth, Janet Meyer, Barbara Palmer, Mable Robinson, Tommy Scherer, Pat Todd, Jackie Zinn and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

PRINCIPAL VEGETABLES BY PRODUCING AREAS

1. WEST
   - A. Escambia county - Potatoes.
   - B. Holmes-Jackson-Washington counties - Butter beans, field peas, watermelons.
   - C. Gadsden county - Pole beans, squash, sweet corn, tomatoes.
2. NORTH
   - D. Starke-Brooker-Lake Butler - Lima beans, snap beans, cucumbers, green peppers, squash, strawberries.
   - E. Hastings - Cabbage, potatoes.
   - F. Gainesville-Alachua - Bush beans, cucumbers, peppers, potatoes, squash.
   - G. Island Grove-Hawthorne - Cucumbers, peppers, sweet corn, squash, watermelons.
3. NORTH CENTRAL
   - H. Oxford-Pedro - Tomatoes, watermelons.
   - I. Sanford-Oviedo-Zellwood - Cabbage, carrots, celery, sweet corn, cucumbers, escarole, greens, lettuce, peppers, radishes, spinach.
   - J. Webster - Cucumbers, eggplant, peppers.
4. WEST CENTRAL
   - K. Plant City-Balm - Bush and pole beans, lima beans, cabbage, cucumbers, eggplant, field peas, greens, squash, strawberries, watermelons.
   - L. Palmetto-Ruskin - Cabbage, cauliflower, potatoes, strawberries, tomatoes, watermelons.
   - M. Sarasota - Cabbage, celery, sweet corn, escarole, lettuce, radishes.
   - N. Wauchula - Cucumbers, eggplant, peppers, tomatoes, watermelons.
5. EAST CENTRAL
   - O. Ft. Pierce - Tomatoes, watermelons.
6. SOUTHWEST
   - P. Ft. Myers-Immokalee - Sweet corn cucumbers, eggplant, peppers, potatoes, squash, tomatoes, watermelons.
7. EVERGLADES
   - Q. Bush beans, cabbage, celery, Chinese cabbage, sweet corn, escarole, greens, lettuce, potatoes, radishes.
8. SOUTHEAST
   - R. Martin county - Cabbage, potatoes, tomatoes, watermelons.
   - S. Pompano - Bush beans, lima beans, sweet corn, cucumbers, eggplant, peppers, squash, tomatoes.
   - T. Homestead - Bush and pole beans, cabbage, sweet corn, cucumbers, potatoes, squash, strawberries, tomatoes.

■ Commercial Vegetables ▨ Watermelons

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT
Most common unit,estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1980-81 crop season

Commodity	Unit	Est. net weight	No. of units per cwt.	Commodity	Unit	Est. Net weight	No. of units per cwt.
		Pounds				Pounds

SUMMARY OF THE 1980-81 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1980-81 crop year totaled $862.4 million, up $73.7 million from the 1979-80 crop year. Acreage harvested was slightly above the previous year. Crops showing the greatest gains in harvested acres were green peppers, potatoes, squash, tomatoes, watermelons and strawberries. Crops increasing in value were snap beans, cabbage, cucumbers, eggplant, escarole, green peppers, potatoes, squash, tomatoes and watermelons. Crops with lower values than the previous year were celery, sweet corn, lettuce, radishes and strawberries. Most of the declines were due to lower season average prices. Potatoes, which rose $36.6 million, showed the greatest increase in value followed by peppers which increased $13.5 million, tomatoes, $11.5 million, and watermelons $6.3 million from a year ago. Celery and radishes showed the greatest declines, down $2.2 million and $3.2 million, respectively, from the previous year.

Average yields for cabbage, sweet corn, green peppers, potatoes and strawberries increased during the year but yields declined for snap beans, celery, cucumbers, eggplant, escarole, lettuce, squash, tomatoes and watermelons.

Season average prices for snap beans, cabbage, celery, cucumbers, eggplant, escarole, green peppers, potatoes, squash, tomatoes and watermelons were higher than a year ago. Prices for sweet corn, lettuce, raidshes and strawberries averaged below the previous season.

Land preparation was active in most areas of the state during July but planting was limited because of generally above normal temperatures. Growing conditions were generally good over most of the farming areas in August, and planting became active. Rains resulting from cold fronts and tropical depressions slowed plantings and field work in early September and October. The weather during October was mostly favorable with generally warm days and mild nights. However, planting and harvesting activities were interrupted by showers in October and November as cold fronts moved across the state.

Temperatures generally averaged below normal during most of December as cold fronts moved over the state. However, the vegetable areas remained free of freezing temperatures and frosts. Precipitation for the month and also the year continued below normal. Light to moderate rains during the last part of the month slowed harvest and delayed field work.

Much of January was well below normal in temperature as a series of polar cold fronts caused freezes and heavy frosts. Severe freezes occurred almost statewide on the mornings of the 13th and 14th. Low temperatures were in the teens and 20's in the vegetable areas. Some acreage was lost and damage, particularly to older plants, was moderate to heavy. Temperatures in the 20's on the 19th compounded the earlier freeze damage. Mild weather prevailed for the remainder of January.

Early February was cold with freezing temperatures as far south as Immokalee on the 4th. Rains and showers were frequent during the month which helped to restore soil moisture after a dry January. Temperatures averaged near normal for the month.

Cool nights, mild days, and mostly light precipitation prevailed during the first half of March. A series of cold fronts brought windy and colder weather for the last half of the month. Scattered frosts occurred in the central interior southward to the Belle Glade-Immokalee area on the 21st.

April was warm and dry. Skies were clear to partly cloudy with only light, scattered showers. Irrigation was very active. Many rivers and water tables were at record low levels since large sections, especially in central and south Florida, had no significant rains since the third week of March. Harvest was in full swing for some crops while others were declining seasonally.

Much of May continued hot and dry. Rainfall was spotty with many areas receiving little or no rainfall. Constant irrigation was required to maintain soil moisture. The first substantial rains of the spring season for many areas fell during the last week of May. Rainfall in central and south Florida averaged 1 to 2 inches with locally heavier amounts. Harvest was very active for some vegetables but declining for others.

The weather picture during June was dominated by hot days and warm nights in the vegetable areas. Scattered afternoon and evening showers and thunderstorms were frequent, but rainfall was variable by areas. The second week of June was very hot with some record highs being set. Hot weather continued into the next week, and daily record high temperatures around 100 degrees occurred in many areas. Temperatures then returned to normal. Harvest was essentially complete for most crops in the major vegetable areas by the end of June.

Most of the weather data for this summary was supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1980-81

Florida growers produced 3.7 million bushels of bush and pole beans during the 1980-81 season for fresh and processing utilization, down 28 percent from a year earlier. Acreage harvested for fresh and processing totaled 42,600 acres, down 22 percent from the 54,300 acres harvested during the previous season. The severe freeze in January resulted in heavy loss of acreage. The average yield for the 1980-81 season was 85 bushels per acre for fresh market and 133 bushels per acre for processing, as compared with 89 bushels and 129 bushels, respectively, for the previous year.

The average f.o.b. price of $10.39 per bushel for fresh market was $2.28 more than the previous year and a record high. Reduced supplies because of freeze damage resulted in very high prices for January and February. At $3.45 per bushel, snap beans for processing are up 48 cents from last season. Total value, at $36.8 million, was slightly above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are produced primarily in Dade County, with small acreages grown in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The north and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from early October into mid June. The fall crop peaked in November. Marketings declined sharply in January and February. Production began to increase in March, and the spring crop peaked in April. Almost 23 percent of the marketings occurred in April, up 4.9 points from April the previous year.

Variable weather influenced the 1980-81 bean crop. Heavy rains in early September delayed planting and field work. In November, a poor market and disease caused by excessive rain resulted in some abandonment in the Pompano area. Colder weather in December slowed growth. In January, a severe freeze and heavy frosts resulted in some lost acreage and extensive plant damage. February volume was down 81 percent from the previous year. The spring weather was mostly hot and dry. Constant irrigation was required to prevent wilting.

CABBAGE
1980-81

Florida cabbage growers produced 7.3 million crates and bags during the 1980-81 season, up 1 percent from the 1979-80 season. The gross value was $27.1 million, a 24 percent increase over the previous season's total of $21.9 million. The average f.o.b. price was $3.73 per crate or bag, up 68 cents from the $3.05 received for the prior season's crop.

Total acres planted amounted to 17,600 acres, down 5 percent from the 18,600 acres planted during the same period in 1979-80. Abandonment was high, primarily due to low prices. The average yield of 459 crates or bags per acre was up 5 crates from the previous season.

Cabbage was available for market in November, continuing through May. Production during the fall season was up from the previous fall, nearer the normal levels. The peak month was April followed by March with May a distant third.

The Hastings area, which constitutes the three counties of Flagler, Putman and St. Johns, is the leading producing area in the state, accounting for 58 percent of the state's total production. St. Johns County continued to lead all counties in acreage, with 4,700 acres harvested, nearly 30 percent of the state's total.

Planting got underway in late August and early September. The most active period was October through December with November being the heaviest month. Transplanting continues as the main method of planting cabbage. Acres seeded directly into fields increased over last season but accounted for only 8 percent of total acreage planted.

First cuttings began in November. Harvest increased slowly at first and then picked up during February, reaching a peak in April. Winter production accounted for 49 percent of the total production, the lowest for that period since the 1977-78 season, while spring production, at 42 percent of the total, was the highest since the 1977-78 season.

CARROTS
1980-81

Production of carrots in Florida continued to increase during the year. There were 1,365,000 cwt. produced in the 1980-81 season. This was 1 percent above the previous year. Fresh use constituted 78 percent and processing 22 percent. This compares with 76 percent fresh and 24 percent processing the previous year. Approximately 16 percent of the fresh carrots were mini or finger carrots compared with 12 percent a year earlier. The remaining 84 percent were the regular type carrots. Carrot acreage, production and value statistics have been added to the state statistical program for the first time. Carrots are not part of the regular National program. However, all data are included in this annual vegetable summary.

There were 10,500 acres harvested from 11,000 acres planted last year. This compares with 9,300 acres harvested from 9,600 acres planted a year earlier. Average price received for the 1980-81 crop was $12.30 per cwt. compared with $8.90 per cwt. the previous year. Total value was a record $16.8 million compared with $12.0 million for the 1979-80 crop.

The muck soils around Lake Apopka, near Zellwood and the Everglades, provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June. The young carrots are subject to cold in January and February each year in the Zellwood area. Some loss occurred in January last year. Generally size and quality were good during most of the harvest period.

CELERY
1980-81

Florida celery marketings of 6.3 million crates were harvested from 10,400 acres during the 1980-81 growing season. The average yield of 605 crates per acre compares with 673 crates the previous year.

Prices averaged higher than the previous year and at $7.09 f.o.b. per crate, compared with $5.70 per crate during the 1979-80 season. Prices during each period averaged above a year earlier. The largest increases occurred in the fall and late spring. The crop was valued at $44.6 million, a decline of 5 percent from the previous crop year.

The Everglades, with 86 percent of the harvested acreage, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 14 percent of acreage and provided continuous supply throughout the season.

Plant bed preparation and seeding were underway by mid June. Transplanting was underway in August and became active in September. Transplantings in the Everglades were interrupted by frequent rains during September. Transplantings for the season in the Everglades ended in early April. Transplantings were complete in the central area in early May. Growers in the Sarasota area normally plant from October to March.

Light harvest began in early November in the Zellwood area and mid November in the Everglades area. Growing conditions were hot and humid during the summer and early fall months. Spraying for leaf miners was active in the fall. Cool weather during December and January was beneficial for growth and development. Quality was variable during the fall but improved to good to excellent during the winter period. Quality was mostly fair to good during the spring period. Yields were generally below the year earlier level. Some seeders occurred in March. No major cold damage occurred to celery. The seeders resulted to some extent from the January cold that moved through the growing area. The midwinter market was on the weak side but prices improved during the spring. Prices overall averaged above year earlier levels. Approximately 9 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality celery.

Celery production was most active December through May with March being the peak month. Cutting was completed in all areas the first week of July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the committee, these data are assembled into weekly, monthly and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1980-81

Chinese cabbage is grown primarily on the mucklands of Zellwood and the Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November. Volume was light through December but increased to a good level in January and peaked in February. Good supplies were available into May. During April and May, Zellwood was providing good supplies while the Everglades was winding down for the season. The season was over by June 1. Quality was generally good during most of the growing season. Cold damage was generally light. Shipments for the season totaled 137,000 cwt. compared with 135,000 cwt. a year ago.

SWEET CORN
1980-81

Florida continued as the Nation's leader in sweet corn production for fresh market. During the 1980-81 marketing year, Florida produced 11.3 million crates of corn. This is 1 percent more than production a year earlier. The increase was due to both a slight gain in acreage and yield per acre. Growers harvested 51,900 acres, up from the 51,800 harvested a year ago. Yields averaged 217 crates per acre compared with 215 crates per acre the previous crop year. Yields have continued above the 200 crate average since the record 244 crates were produced in the 1972-73 crop year.

The season average f.o.b. price of $4.82 per crate was 21 cents below the $5.03 per crate average in the 1979-80 crop season. Sweet corn ranked fourth in value of vegetables produced in the State and was exceeded only by tomatoes, potatoes and green peppers.

First plantings of the season were underway in the Everglades and Zellwood in July. Seeding along the southeast coast got underway in mid September. First harvest began in the Everglades and Zellwood areas in late September. Cutting gained and reached a good level by late October and early November. Harvest shifted from the Everglades to the southeast coast in December. By mid December Dade County began light harvest and reached a good level by mid March. The mid January freeze caused considerable damage to the crop in the Pompano and Dade areas. Yields were reduced sharply. Considerable acreage of older corn was completely lost.

Harvest of the important spring crop was underway in the Everglades in mid April. The Everglades became the main source of supply by early April when the southeast and Dade County were nearing the end for the season. Spring harvest got underway in mid May in the Zellwood area. Supplies were declining in the Everglades by early June and the Zellwood area became the main source of supply into early July. The season was over by mid July.

A small but increasing acreage continued to provide supplemental supplies at Zellwood and the west central area during the early fall and at Sarasota in the early spring.

Weather during the growing season was generally favorable in late fall and spring. Rains in September caused some problems and the freeze in mid January caused considerable loss along the southeast coast. Quality and ear size improved as the season progressed into late winter and early spring.

CUCUMBERS
1980-81

Florida's production of cucumbers for fresh market and processing utilization during the 1980-81 crop year was 4.8 million bushels, down 6 percent from the 1979-80 crop. The fresh market channel utilized 85 percent of the production and the remaining 15 percent was for processing. The 21,200 acres planted was down 1,900 acres from the previous year. Harvested acres totaled 19,900, down 1,800 acres from a year earlier. Average yield per acre for fresh market, at 273 bushels, was down 7 bushels from the previous season. Cucumbers for processing averaged 145 bushels per acre, the same as last year. Total production was valued at $41.9 million compared with $45.7 million for the previous year. The f.o.b. price for 1980-81 averaged $8.85 per bushel for fresh market and $8.09 per bushel for processing, as compared with $8.67 and $10.01 per bushel, respectively, the previous year.

Supplies in 1980-81 were generally available from October through June, with light marketings January through June. Many of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 43 percent of the acreage in 1980-81, is the largest area. The west central area accounted for 29 percent of the planted acreage in the state. The west, north, north central and the southeast areas provide the remaining acreage.

The crop was mostly in good condition during the fall, but heavy rains caused some disease problems in September. Strong, cold winds, starting in December, slowed growth. A severe freeze on January 13 was followed by heavy frosts on January 19. The remaining fall crop was killed, and damage was heavy to young plantings. Considerable replanting was necessary. Strong winds in March whipped vines and caused some leafburn. Spring weather was mostly hot and dry. Irrigation was heavy. Fruit quality, color and size were generally good during the spring season but yields were below normal.

EGGPLANT
1980-81

Plantings totaled 3,100 acres, the same as the 1979-80 season. Yields averaged 592 bushels per acre, 8 bushels below the previous season. Weather was generally favorable during much of the fall, and crop progress was good. Harvest slowed in late November because of poor market conditions but very little acreage was abandoned. No acreage was lost to the severe freeze and heavy frosts in January, but foliage damage was generally moderate to severe. Plants put on new growth and bloom in February but fruit set was light. Windscar and poor color lowered packout during the winter season. Plant condition was generally good to very good during the spring season. Fruit quality, color, size, and yields were mostly good.

Production of eggplant, at 1,658,000 bushels, is 1 percent below last year's production. Total sales increased to \$9.4 million compared with \$7.3 million a year earlier. The increase was due to higher price per bushel only since yield per acre was lower and harvested acres were unchanged compared with 1979-80. The season average price of \$5.67 per bushel is \$1.31 higher than a year ago. Compared with a year earlier, prices for most months were higher, particularly for the winter months.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November, and dropped during the winter. Harvest began to increase in April and reached a peak in May. Peak harvest was a month earlier than usual because above normal temperatures during the spring hastened maturity. Harvest was virtually complete in early July. The southeastern area around Pompano accounted for 50.7 percent of the harvested acreage. The northern and central areas combined contributed 41.8 percent of the acreage harvested with the remaining small acreage in the southwest.

Production is generally continuous through the entire crop year in the southeast and southwest, while the crops in the western, northern, and central areas are for fall and spring harvest only. These areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern growing areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1980-81

Production of escarole and endive during the 1980-81 season totaled 2.9 million crates, down 4 percent from a year earlier. The 6,200 acres harvested were down 100 acres from the previous season. Yield per acre averaged 470 crates compared with 481 crates the previous year.

Prices during the season averaged \$3.91 per crate, compared with \$3.72 a year earlier. The total value of sales, at \$11.4 million, was 1 percent above the previous year. The Everglades, which had 71 percent of the harvested acreage in the 1980-81 season, began seeding in late August. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through May. The mucklands around Zellwood provided good volume in the late spring months. The small acreage grown around the Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to a good volume by November. Marketings reached peak levels in the December through April period. Sales were complete for the season by late May.

Rains interrupted plantings during the fall and the January freeze slowed growth. Growing conditions for the remaining period were generally favorable. Quality of escarole and endive was generally good.

LETTUCE
1980-81

Florida lettuce growers produced 2.7 million cwt. during the 1980-81 season, down slightly from the previous year. A slight decline in average yields more than offset a slight gain in acres harvested. The average yield per acre was 188 cwt. compared with 193 cwt. for the previous year. Growers harvested 14,200 acres compared with 13,900 acres the previous year. The season average f.o.b. price of $13.39 per cwt. was 28 cents below the previous year. Monthly prices through February were well above a year earlier. Beginning in March, prices averaged less for the remaining winter and spring season.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb and leaf.

The Everglades muckland accounted for 87 percent of planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and continued through May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway in late August. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway in late October and harvest continued light until early December. Volume gained significantly in mid December and continued heavy until early May. The peak harvest month was April. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Harvest was completed in all areas by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring seasons.

Growing conditions in the fall were hot and humid. Frequent rains interrupted planting and slowed field work. Several cold fronts slowed growth and caused some damage mostly to outer leaves. Heavy volume was available statewide during March and April. Quality was generally good throughout most of the growing season.

PEPPERS
1980-81

Florida produced 8.0 million bushels of peppers during the 1980-81 season, an increase of 11 percent from the previous year. The average yield of 435 bushels per acre was 5 percent above the 414 bushels per acre last season. Harvested acreage, at 18,300 acres, was 6 percent more than the 17,300 acres harvested in 1979-80.

The season average f.o.b. price of $8.10 per bushel was up from an average of $7.13 for the previous year. The total value of $64.5 million was 26 percent above the previous year. Prices were generally good except for May and June. Sharply reduced supplies in February and March because of the January freeze resulted in prices that were about triple the corresponding prices a year earlier. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

The 9 percent increase in total planted acreage was mostly the result of a 35 percent increase in the southeastern area. Other areas were unchanged to higher except for the north central area which was lower. The important southwest area accounted for 44.4 percent of the state's total pepper acreage. The southeast had 27.7 percent; the north central area, 10.8 percent; the north area, 8.8 percent; and the west central area, 8.3 percent.

During September, hot weather and dampoff necessitated spot replanting to improve stands. Conditions during the remainder of the fall season were generally favorable. Hard freezes in January damaged tender top foliage. Damage was heaviest in older plants. Replanting, cutting back, and planting were active after the January freezes. Crop condition in the spring was generally good despite hot, dry weather. Yields were fair to good.

POTATOES
1980-81

Production of potatoes in 1981, including both winter and spring, totaled nearly 6.6 million cwt. up 24 percent from the previous year. A total of 30,500 acres were planted, 3 percent more than in 1980. Of the total acreage planted, 29,900 acres were harvested, about 10 percent more than the year before. The value of the crop was estimated at $72.9 million, more than double the value of the 1980 crop. The increase in value of production is attributed to a sharp increase in the average price combined with an increase in total production.

The average yield was 220 cwt. per acre, a new record for Florida. The yield was 25 cwt. above 1980 and 5 cwt. above 1979, the previous record. In the Hastings area, which covers the three counties of Flagler, Putman and St. Johns, the average yield was 245 cwt. per acre, also a new record. Spring potatoes grown in all other areas of the State, except Hastings, averaged 240 cwt. per acre which was also a record. The average yield for the winter crop, which was damaged by cold weather, was 155 cwt. per acre, down 40 cwt. from a year ago.

The season average price for all potatoes at $11.10 per cwt. was $4.30 more than the 1980 season. All areas received higher prices than a year ago.

Both "white" and "red" skin varieties are grown over the state. In south Florida where the winter crop is grown the red skin types are the dominant variety. Most of the winter production is sold for table stock but a few are sold to the potato chip industry. In the Hastings area the white skin varieties are the most important. A large percentage of the crop is used in the potato chip industry although table stock use is gaining in importance.

The winter potato harvest got underway the first week of February and progressed slowly until late April. Harvest of the winter crop continued into the early spring months. Digging of the spring crop in the Hastings area started in April. Peak harvest was in May and continued heavy into the first week of June and then declined sharply. Abandonment was less than usual even though the winter crop was hurt by cold weather.

SPINACH FOR PROCESSING
1980-81

Spinach statistics have not been published separately for Florida in recent years in order to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetable" series shown in this publication. Data for 1973 and earlier are available upon request. Yields per harvested acre averaged about the same as a year earlier. Most of the crop is grown in the north central area. Freezing temperatures in January caused a few problems.

SQUASH
1980-81

Florida's production of squash during the 1980-81 season, at 2.4 million bushels, was slightly above last year. Harvested acreage totaled 14,800 acres, an increase of 10 percent from the previous year. The yield, at 159 bushels per acre, was down 15 bushels from the previous year.

The average f.o.b. price of $9.72 per bushel was up 42 cents from last season. Total f.o.b. cash receipts amounted to $22.9 million. High winter prices reflect reduced supplies caused by January freeze damage.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 26 percent of the state's harvested acreage in 1980-81, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring seasons.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and confined mostly to local markets. Conditions were generally favorable during the fall. Marketings increased rapidly to a fall peak in December before showing a seasonal decline during the winter months. In November, mosaic problems caused some early abandonment in the Pompano area. Hard freezes in January killed all plants above ground in the southwest area. In other areas, some acreage was lost and plants of all ages were severely damaged. Replanting was heavy. Poor stands in freeze damaged fields lowered yields. Hot, dry weather in the spring necessitated steady irrigation to prevent wilting. Peak marketings for the season occurred in April. The season was essentially over by the end of June.

RADISHES
1980-81

In 1980-81, radish plantings amounted to 32,900 acres compared with 32,600 acres planted the previous year. Acres harvested totaled 29,000, 2 percent above the previous season but less than the record high of 29,600 acres harvested in 1978-79. Yields per acre averaged 247 cartons, the same as a year earlier. The crop was valued at $20.0 million, down $3.1 million from the previous year. The average f.o.b. price was $2.79 per carton, down 51 cents from the 1979-80 season. Almost all monthly average prices were below the corresponding prices a year earlier.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The fall peak harvest occurred in December. The spring peak occurred in April. Seeding of the 1980-81 crop was underway in the Everglades and the north central areas in early September. Light harvest was underway in early October and became quite active in mid November. A severe freeze in January caused considerable damage to the crop in the central area. Some fields were replanted. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1980-81

Florida strawberry growers produced 5.6 million flats of berries during the 1980-81 season, up 41 percent from the previous year. Harvested acreage totaling 3,200 acres increased 28 percent from the previous year. A record high average yield of 1,750 flats per acre increased from 1,583 flats a year earlier. Yield per acre has increased dramatically in recent years. High yielding varieties have been introduced in the commercial Plant City-Ruskin area. Yields have doubled during the last ten years. The f.o.b. return per flat for the season was $4.98, down $2.08 from the previous season. The value of the crop was $27.9 million, about the same as a year ago.

Laying of plastic and other field work was in full swing by late September in the important Plant City-Ruskin area. Transplanting was underway by mid October and became active the last half of the month. Transplantings were complete by mid November. Early transplantings made good growth and light bloom was showing by the end of November. Light harvest was underway by early December and continued into January. The January freeze caused some problems. Most growers used sprinklers for icing over plants for protection against the cold. Some bloom was lost but plants recovered well and harvest was gaining by early February. Gradeout was above normal due to the cold earlier. Quality and harvest improved in mid February. Peak volume was obtained around mid March and continued heavy into April. Market prices were low in April and some growers sold berries to processors, while others opened fields to U-Pic operations. Quality and berry size were generally good. U-Pic harvest continued into May. Harvest got underway in the Bradford County area in late March. The season was complete in mid May. Most of the acreage in Dade County was for U-Pic and roadside stand operations.

TOMATOES
1980-81

The total value of the Florida tomato crop for fresh market and processing was $256.6 million–up 5 percent from the previous year and a new record for the state. The average price received for fresh tomatoes was $6.58 for a 30-pound carton, 30 cents more than the previous season. This was a contributing factor to the record value for the crop.

Total production of 40.2 million 30-pound carton equivalents was 1 percent above last season. Tomatoes utilized for the fresh market amounted to 96 percent of the total and the remaining 4 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 40.4 percent of the total fresh production; the southwest, 26.6 percent; Dade County, 23.9 percent and the Ft. Pierce-Pompano area, 6.1 percent. The remaining 3 percent was produced in the west, north and north central areas.

The average yield for the state was 836 (30-pound) cartons per acre, down 82 cartons from the year before. The demand was good during the year. Winter production was down sharply from the previous winter as most of the winter acreage was damaged severely by a hard freeze in January. Dade County produces most of the winter acreage. The fall shipments peaked in December with 16.7 percent of the total production. January was the peak month during the winter season, accounting for 13.3 percent. February and March production was below normal due to the freeze in January. The spring production peaked in May with 26.7 percent of the total. Tomatoes are harvested from late October to early July.

The Palmetto-Ruskin area continued to be the acreage leader with 15,950 acres harvested. Dade County was second, harvesting 13,000 acres, followed closely by the southwest area with 12,700 acres harvested. The Ft. Pierce-Pompano area had 3,200 acres harvested and the remaining 1,450 acres were in the north central, northern and western areas. Gadsden County accounted for the largest portion of this acreage.

Tomato planting got underway in July in all areas except Dade County where growers started during the last half of August. Planting made good progress during the fall months. Weather was mostly favorable throughout the entire fall season. On the mornings of January 13 and 14, freezing temperatures caused heavy damage to the winter crop and a heavy loss in production during February and March. The crop recovered by the spring months and production was running above normal. However, market conditions were poor and growers had trouble moving the big spring crop. Harvest was complete in the south by early June but remained active in the Palmetto-Ruskin area, Gadsden County and other central and northern areas into July.

WATERMELONS
1980-81

Watermelon acreage planted during the 1980-81 season totaled 54,000 acres--a 20 percent increase from the 1979-80 period. Of the total acres planted, 49,000 acres were harvested. This was 15 percent more than the previous season. The crop of 8.1 million cwt. was nearly 3 percent above last season's production of 7.9 million cwt. The average yield varied by areas, ranging from an average of 145 cwt. in the northern counties to 253 cwt. per acre in the south. The state average was 165 cwt. per acre, down 20 cwt. from the previous year. The lower yield was due to dry weather.

The average price was a record 6.52 cents per pound, 60 cents above the year before. Prices received by growers for melons were the highest in the south where the early harvest begins. The value of the crop was a record high $52.7 million, 13 percent above last year's previous record of $46.5 million.

The watermelon harvest usually begins in the Immokalee area in April but for the fifth consecutive season, harvest was late getting started because of cold weather during the late winter or early spring. There is a small acreage grown in the fall in the south and usually harvested during November through early January, depending on weather conditions. This acreage is included in the total for the spring season the following year. The harvest season progresses northward into the central areas during May, the northern areas in June and usually ends in the Panhandle during July.

First plantings were made in the southwest in late December. Cold weather during January damaged the early acreage that was up in the south and slowed seed germination in all areas where the crop had been planted.

Harvest was underway during the last week of April and peaked the first week in June. By late June, dry weather was hurting the crop in the north, reducing yields. The season was completed by the end of July.

OTHER CROPS
1980-81

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and the west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee and Everglades areas. Acreage declined from a year earlier. Supplies are available from December through April. At the present time statistics are not available for publication. Shipment information is recorded by the Market News Service. In the 1980-81 season there were 77 thousand cwt. shipped out of state compared with 86 thousand cwt. shipped the previous season. This converts to 350 thousand 22-pound cartons.

Tropical vegetable production decreased from the previous year due primarily to acreage lost to the January freezes. Improved fertilization and spray programs during the growing season contributed to good yields. Acreage harvested was down 1 percent from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for the various vegetables are shown in parentheses. The crops consist primarily of boniatos-ipomea batata (sweet potato); calabaza-cucurbita (pumpkin); malanga-xanthosoma caracu (dasheen, yautios); and yuca-manihot esculenta (sweet cassava). The boniato, calabaza and malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 10,800 acres of tropical vegetables planted in the 1980 calendar year. Peak production of malanga occurs in February through April. Efforts are underway to even out the supply throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabazas are being brought in from Columbia, South America to select those that do best in south Florida. Yuca (cassavas) show a lot of potential as a producer of ethanol to use in gasahol as well as a fresh market vegetable. Flaking and freezing processes are being researched for boniato and malanga. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown throughout the state and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 77 thousand cwt. during the 1980-81 season, down from the 111 thousand cwt. for the previous season.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the state.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipments statistics for out-of-state markets show 17 thousand cwt. for fresh market during the 1980-81 season.

Watercress is available the year round. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially the Sanford area.

Florida Agricultural Statistics

Livestock Summary 1981

FLORIDA CROP AND LIVESTOCK REPORTING SERVICE
1222 Woodward Street, Orlando, Florida 32803

THE STATE OF FLORIDA
DEPARTMENT OF AGRICULTURE
THE CAPITOL
TALLAHASSEE
32304

DOYLE CONNER
COMMISSIONER

Dear Friend:

The Florida livestock industry is a significant component of our State's agricultural economy. Cash receipts from marketings of livestock and their products totaled over one billion dollars in 1981. Florida's beef industry ranks ninth among all states in beef cows, and first among states east of the Mississippi River.

Accurate information is needed for reaching sound decisions on production and marketing strategies, industry policies and other farm business matters. It is hoped that you will find the statistical data in this publication most helpful in meeting this need.

The basic data for this publication was supplied by voluntary reporters from the livestock industry and compiled through the cooperation of the Florida Department of Agriculture and Consumer Services and the U. S. Department of Agriculture.

Sincerely,

Doyle Conner

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA Statistical Reporting Service. Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

CATTLE AND CALVES ON FARMS

Florida's January 1, 1982 inventory of all cattle and calves, including both beef and dairy animals, totaled 2,350,000 head. This was 130,000 head less than a year earlier and represents a 5 percent decrease. On January 1, 1982, cows and heifers that have calved totaled 1,410,000 head, down 7 percent. Beef cows decreased 110,000 from the previous year but milk cows were up by 3,000 head.

Florida ranked 16th in the nation in total cattle and calves, 9th in beef cow numbers and 16th in milk cow numbers on January 1, 1982. Over 619,000 cattle and calves were shipped out of Florida during 1981.

CASH RECEIPTS

Cash receipts from Florida's cattle and calves marketed in 1981 totaled $371,764,000, up 7 percent from last year. Total pounds marketed were up 30 percent from 1980 but prices were lower than last year. Cattle prices averaged $50.40 per cwt., down $9.50 from last year and calves averaged $61.40 per cwt., down $15.30 from 1980.

Receipts from hog marketings totaled $56,125,000, up 6 percent from 1980. Total pounds marketed were down 10 percent but prices received for hogs averaged $43.60 per cwt., up $6.60 from 1980.

HOGS ON FARMS

The December 1, 1981 hog inventory in Florida totaled 257,000 head, down 31 percent from a year earlier. On December 1, 1981, there were 58,700,000 hogs and pigs in the United States, a decrease of 9 percent from December 1, 1980.

BEES AND HONEY

Florida's 1981 honey production of 24,120,000 pounds was up 19 percent from last year and was valued at $12,952,000. The peak number of colonies in production totaled 360,000, up 10,000 from 1980. Florida ranks first in the nation in honey production and second in number of colonies. Producers received an average of 53.7 cents per pound for all grades and types, 1.7 cents more than in 1980. Beeswax brought an average of $1.97 per pound, up 15 cents from last year.

SURVEY METHODOLOGY

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources on slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry producion.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing and the Poultry and Egg Section, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

Published July 1982

CASH RECEIPTS

Florida cash receipts from broilers, eggs and other poultry products in 1981 totaled 226.1 million dollars, up 6 percent from 1980. Receipts from all phases of the industry were up: broiler sales, 98.7 million dollars, up 6 percent; commercial sales of eggs, 122.6 million dollars, up 5 percent; and other poultry product sales, 3.7 million dollars, up 23 percent.

While the annual average price per pound of 27 cents reflected no change from 1980, the record broiler production resulted in the 6 percent increase in receipts. Egg production fell 8 percent from 1980 but the average 1981 price of 52.6 cents per dozen represented a 6.4 cent increase which resulted in the gain in cash receipts.

INVENTORY

Broiler production increased to a record 92,350,000 birds during 1981, 6 percent above 1980. The annual average number of layers during 1981 totaled 11,550,000, a 10 percent decrease from 1980 and 11 percent below the record high in 1979.

PRODUCTION

Florida broiler production in 1981 totaled a record 369,400,000 pounds, 6 percent above 1980. Egg production totaled 2,802,000,000, down 8 percent from 1980 and 12 percent below the record 1979 production. Rate of lay was 66.5 eggs per 100 layers compared to 64.9 in 1980.

During 1981, commercial hatcheries produced 155.4 million straight run chicks. Broiler-type chicks accounted for 76 percent of the total and egg-type chicks 24 percent.

TERMS AND DEFINITIONS

MARKETING YEAR–Poultry production, price and value statistics since 1970, are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed in 7 - 8 weeks.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry products.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY–Monthly estimates of hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Monthly estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees.

Statistical Reporting Service

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, the Agricultural Experiment Station and Cooperative Extension Service, University of Florida.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, USDA, Florida Department of Agriculture; and Agricultural Experiment Station, University of Florida. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

primarily for boiling, and for all other purposes. The average yield for 1981 was 2,970 pounds, 370 pounds more than the 2,600 pound average for 1980. The average price received for the 1981 crop was 27.2 cents per pound, up four cents from the year before. The value of dry peanuts produced was a record $48,470,000, up 46 percent from the short crop of 1980 and nearly 28 percent from the previous record of 1979.

Production of flue cured tobacco totaled 22,848,000 pounds, up 12 percent from the 20,448,000 pounds produced in 1980. There were 9,600 acres harvested, the same as a year ago. The average yield was a record 2,380 pounds, 250 pounds above the year before and 130 pounds above the previous record of 2,250 pounds per acre produced in 1979. The value of the state's tobacco crop was placed at $38,202,000, which is also a record, exceeding the previous high of $33,113,000 for the 1976 crop by 15 percent. The average price for all grades at $1.672 per pound, up 22.2 cents from 1980.

The total area planted to cotton in 1981 was 18,000 acres, three times more than was planted in 1980 and the largest acreage since 1965 when 23,100 acres were planted. Of this total, 17,000 acres were harvested. The average yield in 1981 was 601 pounds of lint cotton per acre, 9 pounds less than the previous year. Total production in 480 pound net-weight bales was 21,300. The average price per pound for lint cotton was 57.0 cents down sharply from the 85.0 cents received the year before. The 1981 cotton crop was valued at $5,828,000 compared to $3,060,000 for the 1980 crop.

Utilized production of all pecans in Florida totaled 5,000,000 pounds, 17 percent less than the 1980 crop but nearly double the 1979 crop when only 2,600,000 pounds were utilized. Of this total, 2,000,000 pounds were improved varieties and 3,000,000 pounds were native or seedling varieties. The average price for all pecans was 53.8 cents per pound. The improved varieties brought 67.0 cents per pound while the native or seedling varieties averaged 45.0 cents per pound. The value of the pecan crop was placed at $2,690,000, 32 percent less than the previous year but 77 percent more than the 1979 crop.

Production of potatoes in 1981, including both winter and spring, totaled nearly 6.6 million cwt. up 24 percent from the previous year. A total of 30,500 acres were planted, 3 percent more than in 1980. Of the total acreage planted, 29,900 acres were harvested, about 10 percent more than the year before. The value of the crop was estimated at $72.9 million, more than double the value of the 1980 crop. The increase in value of production is attributed to a sharp increase in the average price combined with an increase in total production.

The average yield was 220 cwt. per acre, a new record for Florida. The yield was 25 cwt. above 1980 and 5 cwt. above 1979, the previous record. In the Hastings area, which covers the three counties of Flagler, Putnam and St. Johns, the average yield was 245 cwt. per acre, also a new record. Spring potatoes grown in all other areas of the state, except Hastings, averaged 240 cwt. per acre which was also a record. The average yield for the winter crop, which was damaged by cold weather, was 155 cwt. per acre, down 40 cwt. from a year ago.

The season average price for all potatoes at $11.10 per cwt. was $4.30 more than the 1980 season. All areas received higher prices than a year ago.

Both "white" and "red" skin varieties are grown over the state. In south Florida where the winter crop is grown the red skin types are the dominant variety. Most of the winter production is sold for table stock but a few are sold to the potato chip industry. In the Hastings area the white skin varieties are the most important. A large percentage of the crop is used in the potato chip industry although table stock use is gaining in importance.

The winter potato harvest got underway the first week of February and progressed slowly until late April. Harvest of the winter crop continued into the early spring months. Digging of the spring crop in the Hastings area started in April. Peak harvest was in May and continued heavy into the first week of June and then declined sharply. Abandonment was less than usual even though the winter crop was hurt by cold weather.

INTRODUCTION AND SUMMARY OF THE 1981 FIELD CROPS SEASON

INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production and value of production for all major field crops grown in Florida. The period covered for these crops is from 1971 through 1981. County data for the important producing counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1980 and 1981. The complete series of crop estimates dating back to 1919 for the state are available upon request.

Crop estimates are designed to aid Florida farmers, bankers, credit organizations, transportation officials, research workers and others in agriculture, keep abreast of changes and appraise the current and future needs in the light of past experiences. These estimates represent a part of the Department's continuing program to provide comprehensive data for the various segments of agriculture.

SUMMARY 1981 SEASON

The temperatures during January and most of February averaged below normal with the week January 10-16 being one of the coldest weeks on record. Rainfall was ample during these months and soil moisture was adequate; however, there was very little farm activity. Temperatures were near normal during late winter and the spring months. Rainfall during this period was light and dry conditions developed delaying planting of several spring crops. The dry conditions persisted during the growing season reducing yields on crops where irrigation was not available. Crops that were irrigated during the growing season did very well. Harvest of early planted crops was underway by mid summer. Good progress was made during the late summer and early fall months. Most crops, except soybeans and sugarcane, had been harvested by the end of the fall season. The 1981 crop year was considered to be better than 1980 with higher yields for corn, peanuts, soybeans and tobacco. However, the season average price for most of these crops was less than the year before.

Total acreage planted to corn in 1981 was 451,000 acres, 10 percent more than was planted in 1980. Of this total, 327,000 acres were harvested for grain, only 1,000 acres less than the year before. The average yield was 55 bushels per acre, up eight bushels from 1980. The average price received was $2.85 per bushel well under the $3.40 received in 1980. The value of corn produced for grain was placed at $51,257,000, down two percent from the previous year.

The total area planted to soybeans in 1981 was 475,000 acres, the same as planted in 1980. More acres were planted to soybeans than any other field crop grown in the state. There were 460,000 acres harvested for beans which was also unchanged from the year before. The average yield per acre was 24 bushels, up two bushels from 1980 but still five bushels below the 1979 average of 29 bushels. The average price for a bushel of soybeans was $6.20, down $1.70 per bushel from the year before. The value of the soybean crop was placed at $68,448,000 which was 14 percent less than 1980. Soybeans continue to rank second as the state's most valuable field crop.

The total area of sugarcane harvested for sugar and seed was estimated at 348,200 acres, about three percent more than was harvested in the 1980-81 season. Of this total, 334,400 acres were harvested for use in making sugar while the remaining 13,800 acres were used for seed for replanting or planting new acreage. Average yield for the season was 28.8 tons per acre,2.4 tons below a year ago. The lower yield this season was caused by freezing temperatures in December and January. Total cane harvested, including that used for seed, was 10,019,000 tons, down five percent from the previous year's record. The value of the 1981 crop will not be available until a later date. The 1980 value of production for sugarcane used for sugar and seed was $417,325,000, averaging $39.40 per ton.

Hay production in the state during 1981 totaled 483,000 tons, down 12 percent from the 552,000 tons harvested in 1980. Hay, including all kinds, was harvested from 230,000 acres, 4 percent less than was harvested in 1980. The average yield was 2.1 tons per acre, down .2 tons from the last two years. Farmers selling hay received $71.00 per ton, an increase of $6.00 from the $65.00 received in 1980. The total value of all hay produced was $34,293,000, down 4 percent from the year before.

There were 69,000 acres of peanuts planted in the state in 1981, up six percent from the year before. Of the total planted, 60,000 acres were harvested for dry peanuts. The remaining 9,000 acres were harvested as "green peanuts", used

"WHY CROP AND LIVESTOCK REPORTS"

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing and provide them with an orderly market.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price by removing uncertainty of supply.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce uncertainty which limits speculation in farm products. Speculation adds to the cost of marketing.

They indicate potential buying power enabling manufacturers to meet the probable demand.

They provide an accurate, reliable, unbiased picture of Florida's agriculture and furnish a sound basis for judgment and action by farmers, other individuals, business men, transportation agencies, crop and livestock interests, and governmental agencies.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's dairy industry. It is intended for the use of dairymen, allied industries, and all others who are interested in dairy statistics.

Many dairy producers, marketing agencies, Federal Order Market Administrators, and others voluntarily supplied basic data used to develop these statistics. Their cooperation is sincerely appreciated.

This report is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Dairy Farm Inspection, Division of Dairy Industry. Shipment data are from the Road Guard Bureau, Division of Inspection and Bureau of Dairy Laboratories, Division of Dairy Industry. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

DAIRY SUMMARY

On January 1, 1982, cows kept for milk production on Florida farms and commercial dairies numbered 190,000 head, 3,000 more than a year earlier. Milk cow replacement heifers, 500 pounds and over, on hand January 1, 1982, totaled 45,000 head, 15 percent more than last year. The combined total of milk cows and replacement heifers, 500 pounds and over, was 235,000 head, 4 percent more than January 1, 1981.

Florida dairies produced a record 2,082 million pounds of milk in 1981. Production was 3 percent above the previous year. Record production per cow averaged 11,016 pounds in 1981 which was 171 pounds more than the 1980 average.

Cash receipts from marketings of Florida milk in 1981 totaled $347,592,000, an increase of 10 percent from 1980. Milk marketed by producers averaged $16.80 per hundredweight in 1981 compared to $15.80 in 1980.

The United States dairy herd size continued the increase which began in 1980. The 1981 annual average totaled 10,919,000 milk cows, 1 percent above the 1980 annual average. Milk replacement heifers on farms January 1, 1982 numbered 4,530,000 head, 4 percent above the previous year.

Total milk production was a record 132.6 billion pounds in 1981, 3 percent above the 1980 output. Milk production per cow averaged 12,147 pounds, another record and 258 pounds more than 1980.

Farmers' cash receipts from marketings of milk in 1981 were a record high $18,077 million for the Nation, 9 percent more than the previous record of $16,584 million in 1980.
